

Area 22

Meeting Week 3

04 february 2019 / 4:30 PM / ROOM 436

ATTENDEES

Nathan, Johannes, Nick, Ardy, Jari

NOTES

- Hash passwords before they are entered into the database.
- Put higher priority on basic features.
- Jackson is a java library for turning java into Json.
- Program has to count only your improvements, not your previous.
- All data is stored on the server.
- Data stored on the server is updated dynamically, when you change your setting on the client, it sends a custom SQL query to the server to update your data.
- Many useless branches were deleted.
- GUI logic needs to be tested.
- Java GUI builder from Eclipse will be used.
- Jackson works by formatting a special query class into a special json class, then we send that to the server.

NOTES with TA

- Nathan's birthday!
- Todos for this week: everyone did their todos.
- GUI testing file is shown to the TA, TA likes it, says it's not mandatory.
- TA said testing should be done using junit.
- Does the frame-making of the GUI be tested? TA said he will get back to us about it.

- **During demonstration:** We should run an HTTP server (Spring) to send JSON requests.
- **Tasks will now be distributed for each member for next week.**
- **Add workspace.xml to .gitignore**
- **Explanation Sprint by TA:** for each task, what the effort was, if it's done (if not, migrated to next week), problems encountered, the template is on Brightspace
- **Gitlab scrum board has to be based on backlog tasks.**
- **Standup meeting:** each one of us says goals for today each time we meet up. According to TA, what have done, what going to do, problems faced. Has to be done on monday too.
- **TA: demos so far are very good.**

ACTION ITEMS

1. Implement first co2 counting program.
2. Integrate username + password file into database.
3. Write a main class that launches the login window, then the main window.
