

Things to talk about:

- How far along are we with connecting the, GUI, the client, the server and the database?
- How are we going to make sure that our Git Repository stays clean and that we keep track of what needs to be done and what doesn't?
- What still needs to be done with the GUI?
- Who will be coding which feature for the next deadline?
- What are the essentials to know for everyone about how the server works right now, in what files are we coding and what files need to be tested?
- JaCoCo and Checkstyle, the JaCoCo errors and our Checkstyle errors
- Anything else anyone would like to talk about.

Things to do until next week:

- Clean up our Git mess, push everything to master that we need and then start cleaning it.
- Get everything ready for the next sprint, clear startingpoints with where we need to start coding our other features and what goals are we setting for ourselves for the final project.
- Clean up our Scrumboard and add new tasks to it, make it more clear to everyone what is happening at a certain time

Deliverables/Goals:

- Get rid of all the checkstyle errors and expand tests on current classes.
- A clear location on where to continue our coding for the next features for week 8.
- A nice and clean GitLab

Responsibilities:

- Perhaps we need to divide the work a better more even the coming weeks, some have done more than others!
