

Notes meeting 2

- Never push to master – it is good practice if at least one other person has to approve merge to master
- JSON communication is necessary
- RESTful api is a bonus
- Floobits is no substitute to GIT
- we are not allowed to use node.js for the server – only Java is allowed
- On the deadline it should be on the master branch
- The two people that have to approve it before merging – it is not necessary to have 2 people
- User story describes a certain need and it is usually written in a certain format – from the user story we can get tasks – i.e. get the table in the database to take notes, one person can be assigned to a task and one person is responsible. Every week is a sprint, now just create a backlog
- Using Scrum for this course means using the templates on BrightSpace
- We will not have access to Jira from TU Delft
- We get a bonus if in week 2 we already implement a database that stores the communication between the server and the client
- We can make use of the Spring framework
- Using the Squaretest plugin
- We should look into the mistakes that occur when using Jacoco and Checkstyle
- We have to make an agenda + meeting notes every week and not just when we have to present something
